The Energy Transition

Richard Markeson

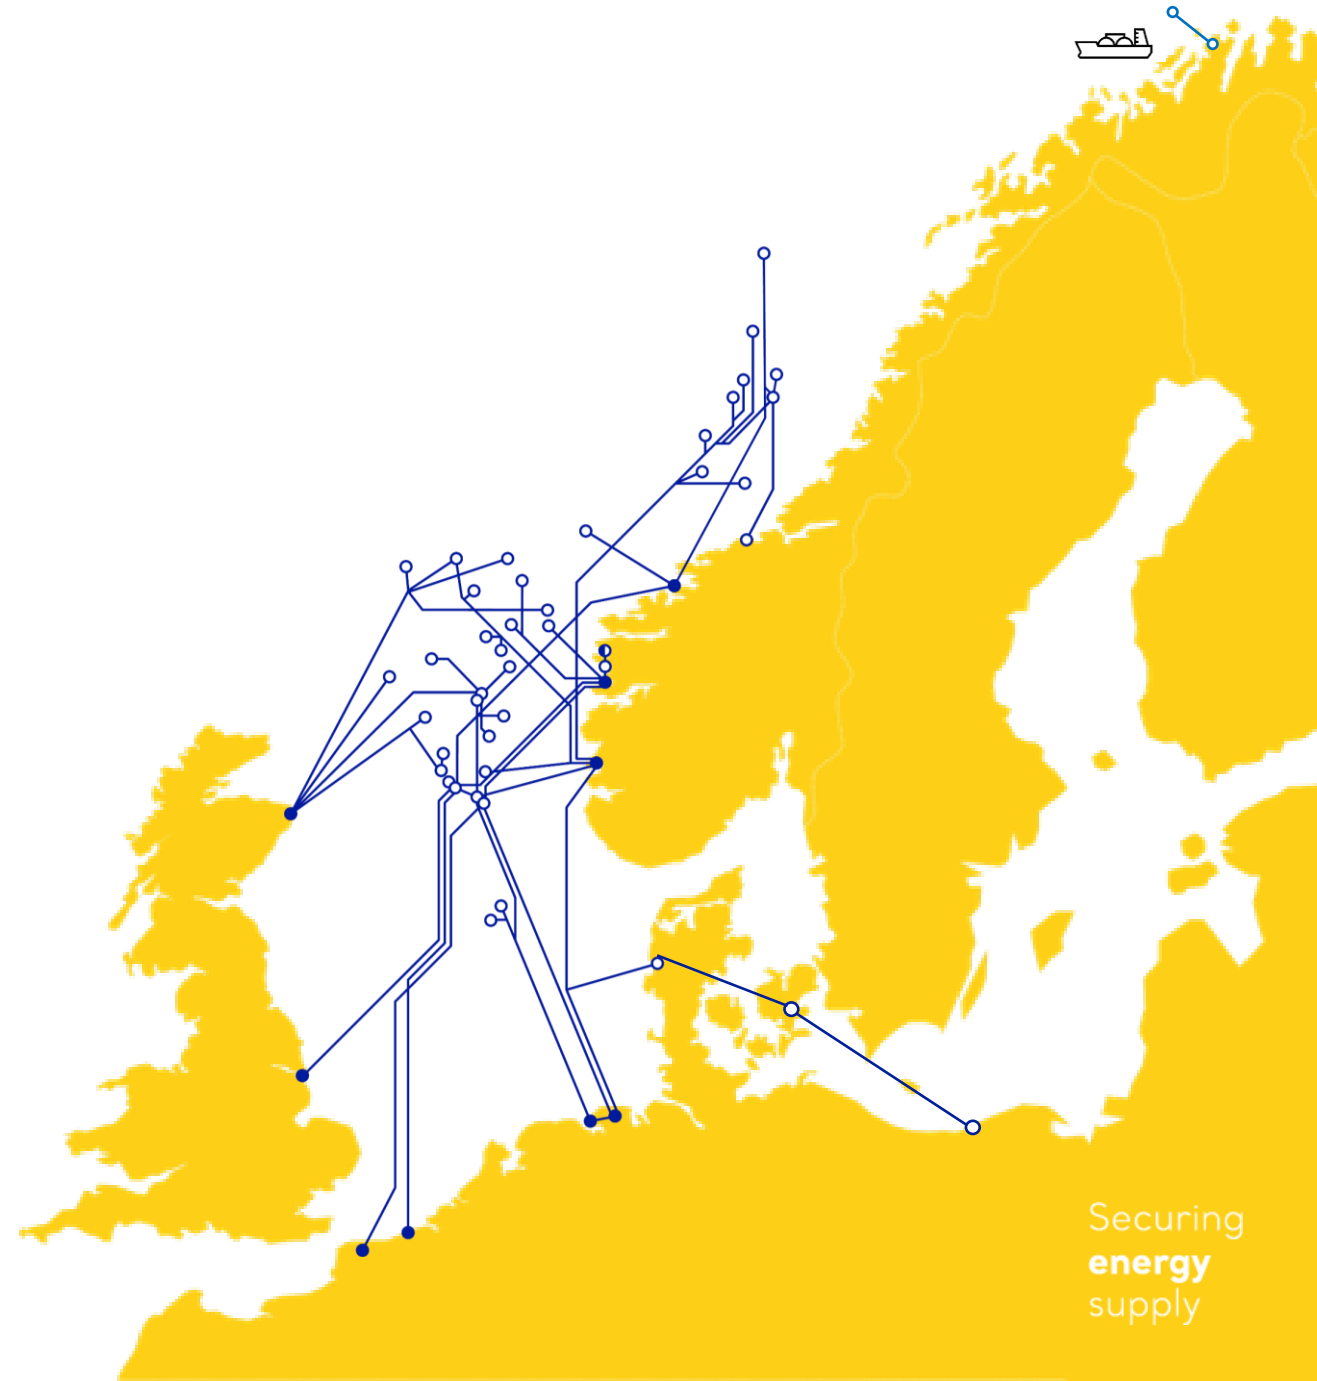

Program Manager R&D – Sustainable Development

The worlds biggest offshore energy network is going to be developed, decarbonised and coupled to include

Hydrogen production

Offshore wind power

CCS

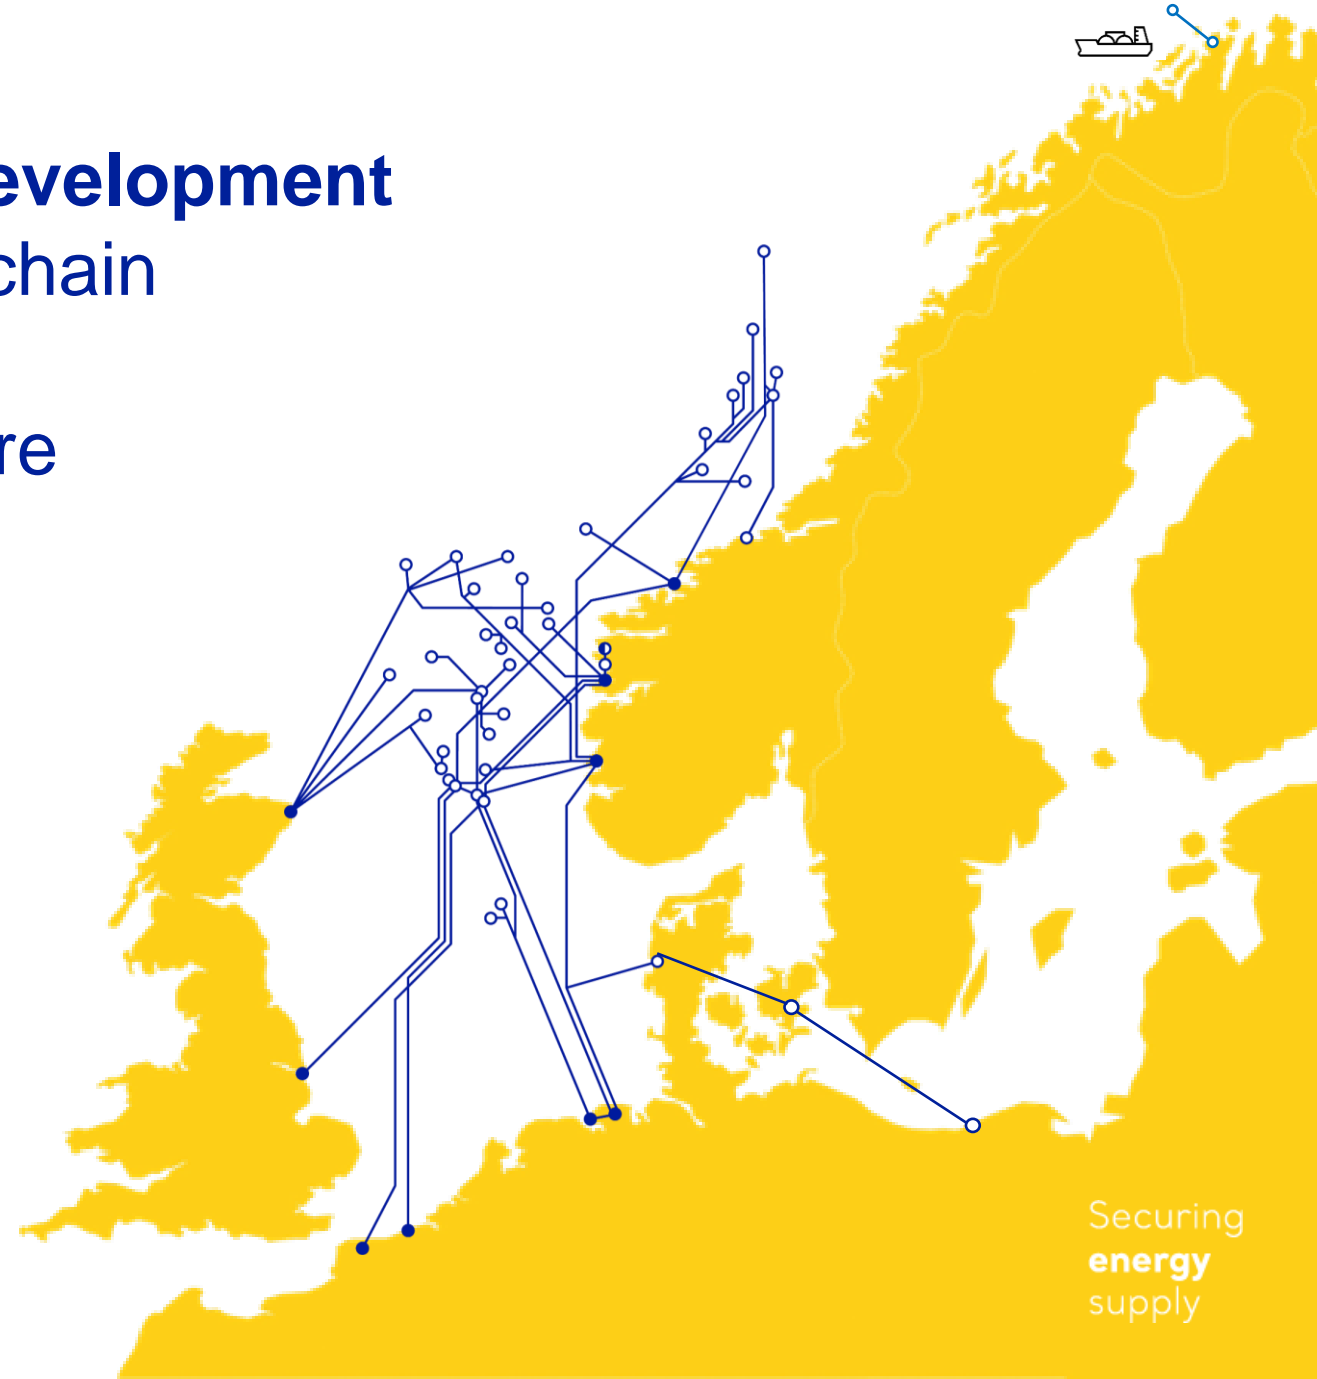

This coupling is a part of
the development required to
transition to a sustainable future

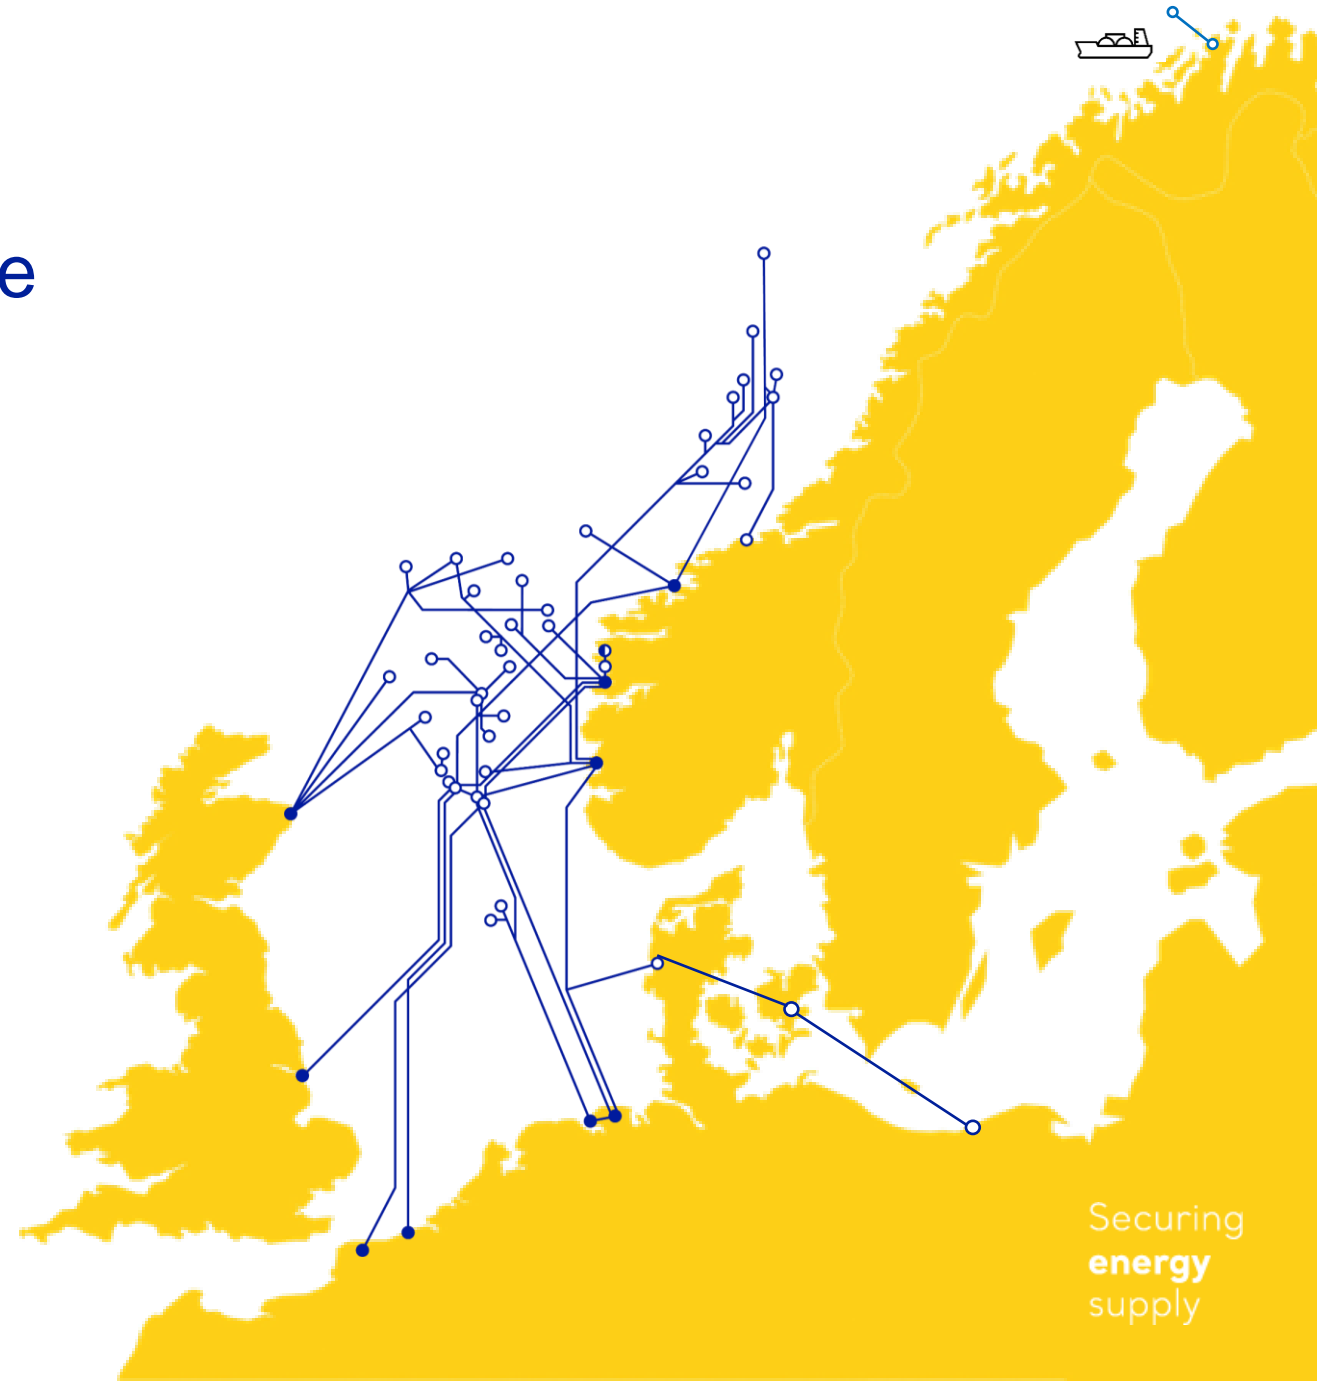

To achieve this transition, **R&D development** is needed along the whole value chain

- from production and infrastructure to consumption

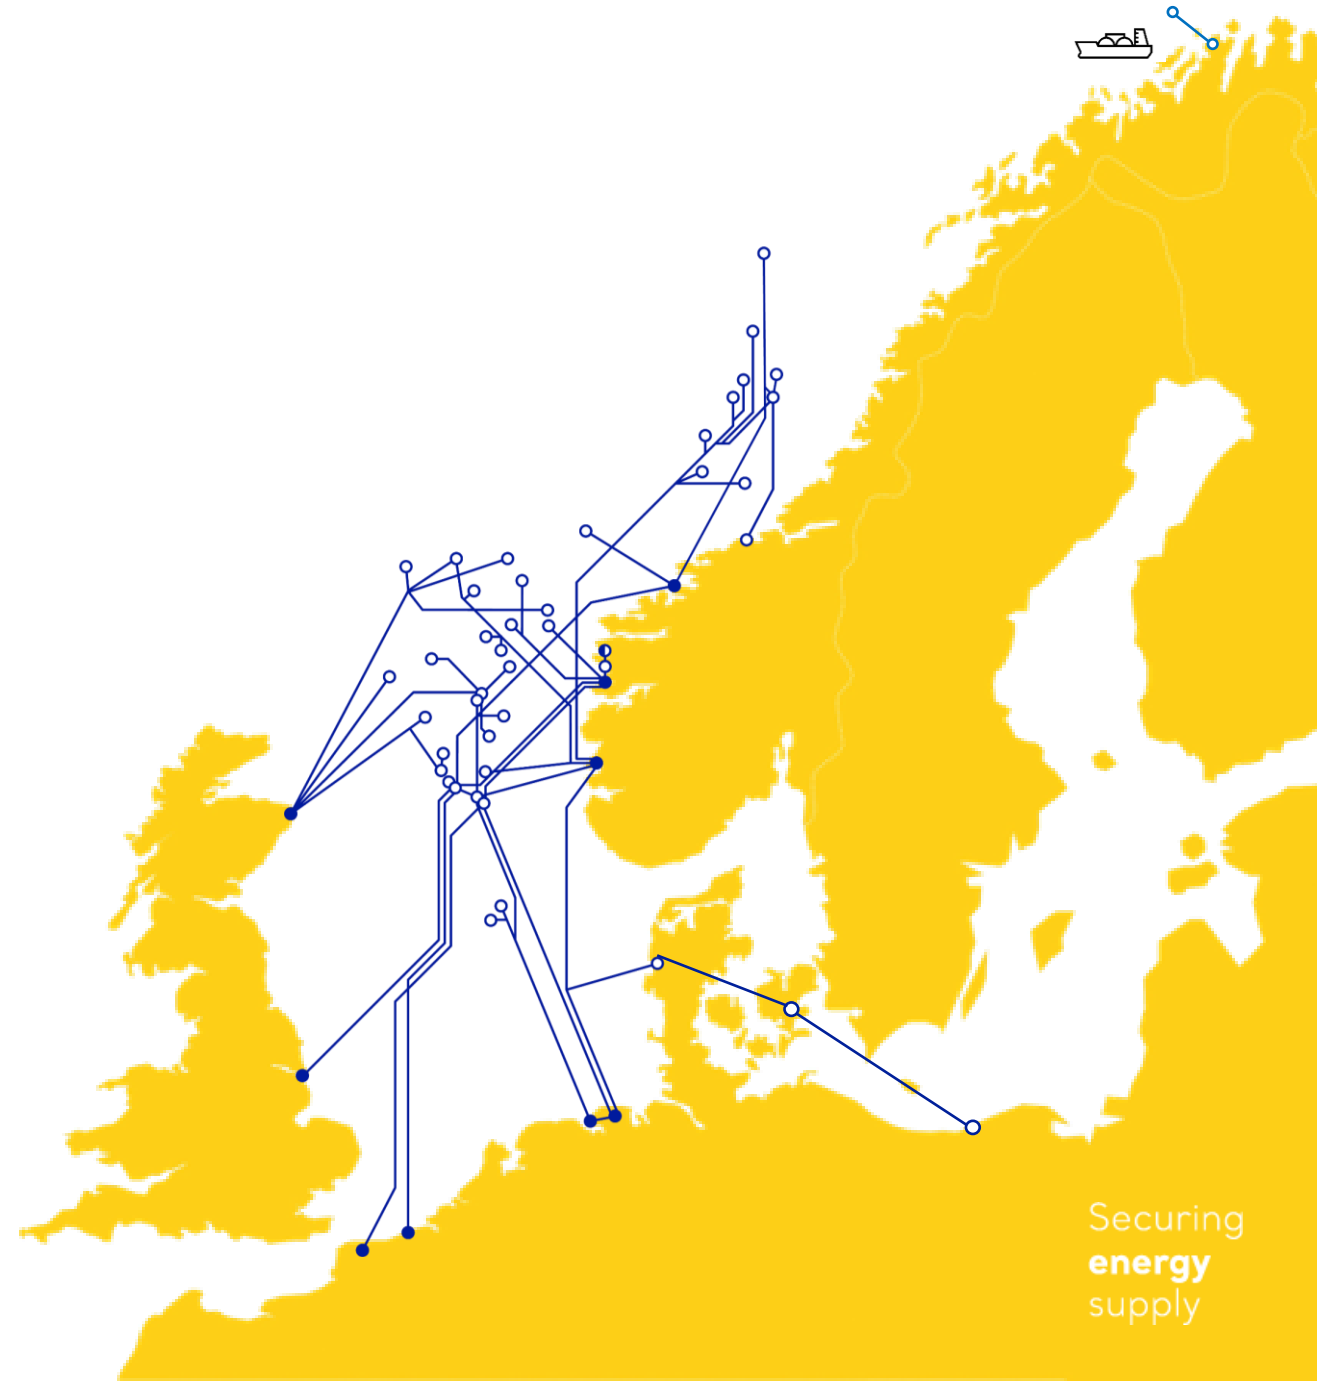

Natural gas based low carbon
Hydrogen will be able to contribute
the volumes to start a
new value chain
where there is large scale
production and export of
**clean energy from Norway to
Europe**

R&D is needed to enable the transition

- from **low carbon Hydrogen** to **renewable Hydrogen**

Gassco will continue to focus on **cooperating with industry and research community** to help the energy transition process
