

Protan Feature Roof

Your design - Our solution

vast design potential

Protan feature roofing supports

The most complex and technically demanding type of roof construction is the flat roof, and Protan roofing membranes have been used in this way for over thirty years.

A visible roof may need to reflect the requirements of the local planning authority. Protan roofing materials are also suitable for sloping or curved roofs, including vertical applications. With constructions like these, the roof is more prominent on the building, making even greater demands on the aesthetics of the roofing material.

The long lifespan and the mechanical strength of Protan roofing membranes are well documented, and require a minimum of maintenance. Combining them in a wide choice of colours and profiles makes it possible to build exclusive, personalised roofs and express innovative design.

This is what we call feature roofing.

Architectural profiles

Architectural profiles can be welded on to the roofing, either in the same colour as the roofing or in a contrast colour. On large roofing surfaces this provides structure and interest.

Two types of profiles are available: triangular profiles and Omega shaped profiles. These profiles are welded on top of the roofing material without any penetration. The profiles can be spaced as desired, to give different effects in the building design, including standing seam effect.

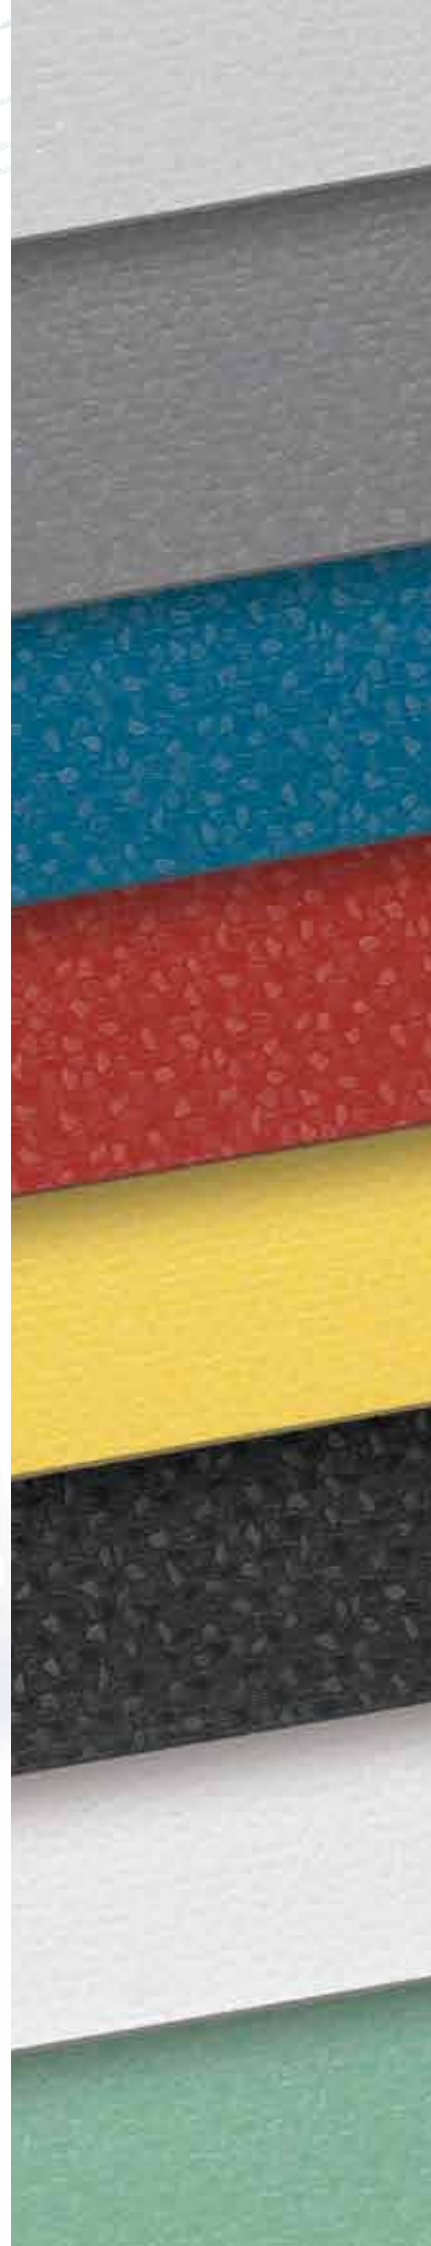

your creativity

Colours

Protan roofing materials are available in a variety of standard colours. Special colours can also be produced to order. Why not use several colours on the same roof surface? Unique effects can be created which are not possible with other roofing materials.

It is also possible to use different colours to design your own logo on the roof. A logo can be pre-engineered to the client's specification and be fitted after the roof completion.

By choosing Protan you will understand what flexibility means in reality in roofing design.

design function quality support

Going forward with confidence

Since the beginning of the 1970's, over 60 million square metres of roofs have been covered with Protan roofing membranes. Through the vast practical experience of it's own roofing contracting division, Protan's complete roof systems are developed to fulfill all roof functions.

Our products and systems are produced to conform to the latest stringent EN-standards (European Norm) and Factory Mutual. The installation is by approved Protan Partner Contractors. This ensures quality in every stage from production to roof completion, and beyond.

Through continuous product development, we are constantly making improvements both to our products and our service.
